A Portable LaTeX Project

Sample Author

18 October 2026

1 One project, one build configuration

This independent example uses pdfLaTeX by default. Set the engine to `xelatex` in the local `.latexmkrc` to build it with XeLaTeX. There are no operating-system font names or personal paths in this document. Latexmk resolves references and runs BibTeX when required[1].

2 Mathematics and cross-references

For a resistor with resistance R, the current is

$$I = \frac{V}{R}. \tag{1}$$

Equation (1) and Table 1 are linked to their definitions. No reference numbers are entered manually.

Table 1: Illustrative values, not experimental measurements.

Voltage / V	Current / mA
1.0	1.0
2.0	2.0
3.0	3.0

3 Building from another folder

The helper scripts locate this project relative to their own location. The editor recipe resolves paths relative to the root TeX file. Consequently, moving the repository does not require editing absolute paths.
